

Assignments

1. Convert seed SQL to CSV import

Current file: 005-seed-access-control.yml uses raw SQL. Please replace it with:

src/main/resources/db/changelog/data/access_permissions.csv

src/main/resources/db/changelog/data/access_roles.csv

src/main/resources/db/changelog/data/role_permissions.csv

using Liquibase loadData.

2. Add search with pagination

Currently GET /roles and GET /permissions return Flux.

Add:

GET /api/v1/access-control/roles/search?

keyword=admin&active=true&page=0&size=10

GET /api/v1/access-control/permissions/search?

module=ROOM&keyword=create&page=0&size=10

3. Add role detail with permissions

Current role detail returns only role data.

Add:

GET /api/v1/access-control/roles/{roleId}/detail

Response:

```
{
  "id": "...",
  "code": "PROPERTY_MANAGER",
```

```
"name": "Property Manager",
"permissions": [
  {
    "code": "ROOM_CREATE",
    "name": "Create room"
  }
]
}
```

4. Add permission group

Current permission has:

AccessModule module

Add one more field:

String groupCode

Example:

```
ROOM_MANAGEMENT
PROPERTY_MANAGEMENT
MEDIA_MANAGEMENT
OWNER_MANAGEMENT
```

5. Protect system role

We already have:

systemRole

Assignment:

We must prevent update/delete of system roles.

Example:

SYSTEM_ADMIN cannot be deleted

SYSTEM_ADMIN cannot be disabled

PROPERTY_OWNER system role cannot be renamed

6. Add soft delete

Current delete likely deletes directly.

Better assignment:

deleted

deletedAt

deletedBy

Then:

DELETE /api/v1/access-control/roles/{roleId}

PATCH /api/v1/access-control/roles/{roleId}/restore

7. Add unit tests

Best classes to test:

AccessCodePolicyImpl

ScopePolicyImpl

RoleFactoryImpl

PermissionFactoryImpl

RoleManagementFacadeImpl

PermissionManagementFacadeImpl

Use:

JUnit 5

Mockito

StepVerifier
